

Types of Networking Devices

Device Function Example

1. Router

- **Connects different networks together** (like your home network to the internet).
- Routes data from one network to another.
- **Has an IP address.**

✓ Example: Home Wi-Fi router (TP-Link, D-Link).

 Connects your devices to the **Internet**.

2. Switch

- **Connects multiple devices in a local network (LAN).**
- Sends data only to the device that needs it (MAC address-based).
- **Faster and smarter than a hub.**

✓ Example: Office network switch connecting PCs and printers.

3. Hub

- Basic device to connect multiple devices.
- **Broadcasts data to all devices**, not smart like a switch.
- Rarely used now (replaced by switches).

✓ Example: 4-port hub in old LAN setups.

4. Modem (Modulator-Demodulator)

- Converts **analog signals** (used by telephone lines) into **digital** for computers and vice versa.
- **Connects to ISP** (Internet Service Provider).

✓ Example: BSNL or Jio modem at home.

5. Access Point (AP)

- Provides **Wi-Fi access** to devices in a network.
- Used in large buildings to extend wireless range.
- ✓ Example: Wireless access point in hotels, airports, offices.

7. Repeater

- Boosts or regenerates weak signals in a network.
- Extends the range of a network (especially in long distances).
- ✓ Example: Used in large buildings or wired networks.
